01 / Frame buffer baseline

Example data - freely redistributable under CC0-1.0

Retrieval marker: FRAMEBUFFER2026

A frame buffer stores recent observations for embodied question answering.

The example baseline retains raw features from a fixed number of frames.

Longer sequences increase memory usage and introduce irrelevant evidence.

This document defines test inputs only. It reports no measured accuracy.

No real participants, experiments, or scientific results are represented.

02 / Room identity constraint

Example data - freely redistributable under CC0-1.0

Retrieval marker: ROOMMERGE2026

A room identity constraint prevents merging objects across different rooms.

Multiple views of the same object are aggregated before matching candidates.

The planned evaluation compares object duplication and peak memory usage.

This is an original fictional research note, not a published paper or result.

No real participants, experiments, or scientific results are represented.
